Oracle Engineered Systems Numbers

- 1000+ Oracle Engineered Systems which AEG have configured, patched or supported.
- 120+ AEG resources which have an average 15+ years of Oracle experience
- AEG Support across 9 countries
- 200 Oracle Engineered Systems (Exadata/Exalogic, etc) currently under management directly by AEG
- 200+ customers in either the AEG Managed Services program or remoteDBA program
- 50,000 Accenture Oracle IDC resources that can be leveraged for Level 1 & Level 2 support

Our consultants have been published in multiple subject areas and additional online resources that demonstrate Accenture's experience and expertise with the OES platform

**BEFORE ANYTHING
HOW THIS ALL
STARTED..**

Questions:

- Which volumes I have across all compartments in all regions that are unallocated?
- I want a list of all computes I have across all regions..
- What is the total boot+block storage allocated per compute?
- Which security list I have that are not being used by any subnet?
- What is the linear regression cost trend of my tenancy?
- Which users created volumes in my prod compartment yesterday?
- ...

```
#!/bin/bash
compartment=ocid1.compartment.oc1..aaaaaaaaecfyyp6fpwtbrv54irhpeywjifxekm3rwrkndsg46rz2ecjbon3q

# Fetch all compute instances for compartment
echo "Getting computes..."
computes=$(oci compute instance list -c $compartment)

# Fetch all VNIC attachments for compartment
echo "Getting vnicAttachments..."
vnicAttachments=$(oci compute vnic-attachment list -c $compartment)

# Loop through compute instances
for computeIdx in $(echo "$computes" | jq '.data | keys | .[]'); do

    # Extract instance OCID
    computeOCID=$(echo "$computes" | jq -r ".data[$computeIdx].\"id\"")

    # Extract instance name
    computeName=$(echo "$computes" | jq -r ".data[$computeIdx].\"display-name\"")

    # Extract VNIC attachment OCIDs for this instance
    vnicIds=$(echo "$vnicAttachments" | jq -r '.data[] | select(.\"instance-id\" == \"$computeOCID\") | .\"vnic-id\"')

    echo "$computeIdx $computeName"

    # Loop through VNICS of this instance
    for vnicId in $vnicIds; do

        # Extract various attributes and print them
        vnic=$(oci network vnic get --vnic-id $vnicId)
        privateIp=$(echo $vnic | jq -r '.data | ."private-ip"')
        publicIp=$(echo $vnic | jq -r '.data | ."public-ip"')
        vnicName=$(echo $vnic | jq -r '.data | ."display-name"')

        printf "  VNIC $vnicName (${vnicId:(-5)}) :  Public: $privateIp Private: $publicIp\n"

    done
done
```

Cost Section ...

The screenshot shows the Oracle Cloud Cost Analysis interface. On the left, a sidebar lists 'Account Management' and 'Cost Analysis' (which is selected). Below 'Cost Analysis' are links for 'Cost and Usage Reports', 'Budgets', 'Invoices', and 'Payment Method'. The main content area is titled 'Cost Analysis' and contains a yellow warning box stating: 'Cost data may be delayed by approximately 4 days. We are working to resolve this issue and apologize for the inconvenience.' It also says 'For dates older than 2020-04-01 switch to classic version'. Below this are filter controls: 'TIME PERIOD (UTC)' set to 'This Month (Aug 2020)', 'SHOW' set to 'Cost', and 'REPORTS' set to 'Costs by Service'. There are also 'FILTERS' and 'GROUPING DIMENSIONS' sections with dropdown menus and buttons for 'Apply', 'Cancel', and 'Clear All Filters'. At the bottom, it says 'Time Period : Aug 2020' with an info icon.

Compartment Explorer ...

The screenshot shows the Oracle Cloud Compartment Explorer interface. The left sidebar has a 'Governance' section with links for Audit, Compartment Explorer (which is selected and highlighted in blue), Quota Policies, Limits, Quotas and Usage, Tag Namespaces, and Compliance Documents. It also includes Tag Filters, a search bar for compartments, and a tree view of compartments under 'dbarj (root)' which includes 'compt_dev', 'compt_prod', 'compt_ss', and 'compt_test'. A checkbox for 'SHOW RESOURCES IN SUBCOMPARTMENTS' is checked. The main right area is titled 'Compartment Explorer' and shows details for the compartment 'dbarj.(root)'. It includes fields for Name (dbarj.(root)) and Description (dbarj). A message box says 'Don't see what you're looking for? These results include only resources supported by [Search](#). Updates made to resources might not immediately appear here.' Below this is a table titled 'Volume Backups (7)' with columns for 'Name' and 'Compartment'. The table lists seven entries: 'test_vol_full_1' (dbarj (root)/compt_dev/compt_dev_app), 'test_vol_full_1' (dbarj (root)/compt_dev/compt_dev_db), 'test_vol_incr_2' (dbarj (root)/compt_dev/compt_dev_app), 'teste' (dbarj (root)/compt_dev/compt_dev_app), 'u01_Full' (dbarj (root)/compt_dev/compt_dev_app), 'u01_Full_2' (dbarj (root)/compt_dev/compt_dev_app), and 'u01_Incr_3' (dbarj (root)/compt_dev/compt_dev_app). At the bottom, it says '0 Selected'.

Name	Compartment
test_vol_full_1	dbarj (root)/compt_dev/compt_dev_app
test_vol_full_1	dbarj (root)/compt_dev/compt_dev_db
test_vol_incr_2	dbarj (root)/compt_dev/compt_dev_app
teste	dbarj (root)/compt_dev/compt_dev_app
u01_Full	dbarj (root)/compt_dev/compt_dev_app
u01_Full_2	dbarj (root)/compt_dev/compt_dev_app
u01_Incr_3	dbarj (root)/compt_dev/compt_dev_app

Advanced Resource Query ...

The screenshot shows the Oracle Cloud Advanced Resource Query interface. At the top, there's a navigation bar with the Oracle Cloud logo and a search bar. Below the search bar is a section titled "ADVANCED RESOURCE QUERY" containing a query editor and a preview pane.

Query Editor:

```
query
all resources
where
systemTags.namespace = 'orcl-cloud' &&
systemTags.key = 'free-tier-retained' &&
systemTags.value = 'true'
```

Preview Pane:

You can filter results more specifically with query language. For help constructing queries, see [Search Language Syntax](#). These results include only supported resource types. For more information about what resources you can find in Search results, see [Supported Resources](#).

Software Development Kits and Command Line Interface

Oracle Cloud Infrastructure provides a number of Software Development Kits (SDKs) and a Command Line Interface (CLI) to facilitate development of custom solutions.

- Software Development Kits (SDKs) Build and deploy apps that integrate with Oracle Cloud Infrastructure services. Each SDK provides the tools you need to develop an app, including code samples and documentation to create, test, and troubleshoot. In addition, if you want to contribute to the development of the SDKs, they are all open source and available on GitHub.
 - [SDK for Java](#)
 - [SDK for Python](#)
 - [SDK for TypeScript and JavaScript](#)
 - [SDK for .NET](#)
 - [SDK for Go](#)
 - [SDK for Ruby](#)
- [Command Line Interface \(CLI\)](#) The CLI provides the same core capabilities as the Oracle Cloud Infrastructure Console and provides additional commands that can extend the Console's functionality. The CLI is convenient for developers or anyone who prefers the command line to a GUI.

My option: OCI-CLI

- Built on Python 3.5 or later
- Mac, Windows, Linux
- Calls OCI APIs via REST
- Easy to install and configure:
 - [`https://github.com/oracle/oci-cli`](https://github.com/oracle/oci-cli)
 - `bash -c "$(curl -L https://raw.githubusercontent.com/oracle/oci-cli/master/scripts/install/install.sh)"`

List all Instances:

```
$ oci compute instance list --all
```

Usage: oci compute instance list [OPTIONS]

Error: Missing option(s) --compartment-id.

THIS IS FOR COMPUTES..

WHAT ABOUT BOOT VOLUMES?

oci bv boot-volume list -h

NAME

bv_boot-volume_list -

DESCRIPTION

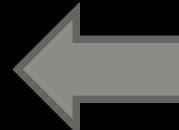

Lists the boot volumes in the specified compartment and availability domain.

USAGE

```
oci bv boot-volume list [OPTIONS]
```

REQUIRED PARAMETERS

--availability-domain [text]

The name of the availability domain.

Example:

```
Uocm:PHX-AD-1
```

--compartment-id, -c [text]

The OCID
<https://docs.cloud.oracle.com/Content/General/Concepts/identifiers.htm>
of the compartment.

Now all BVs over all Comparts of all ADs of all Regions

What is required?

FOR I in Subscribed Regions

FOR J in ADs

FOR K in Compartments

> list boot volumes <

THIS IS FOR BOOT VOLUMES..

*WHAT ABOUT BOOT VOLUME
BACKUP ASSIGNMENTS?*

```
$ oci bv volume-backup-policy-assignment get-volume-backup-policy-asset-assignment -h
```

NAME

bv_volume-backup-policy-assignment_get-volume-backup-policy-asset-assignment -

DESCRIPTION

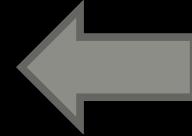

Gets the volume backup policy assignment for the specified volume. The assetId query parameter is required, and the returned list will contain at most one item, since volume can only have one volume backup policy assigned at a time.

USAGE

```
oci bv volume-backup-policy-assignment get-volume-backup-policy-asset-assignment [OPTIONS]
```

REQUIRED PARAMETERS

--asset-id [text]

The OCID of an asset (e.g. a volume).

Now all Backup Policies over all BVs over all Compartments of all ADs of all Regions

What is required?

FOR I in Subscribed Regions

FOR J in ADs

FOR K in Compartments

> list boot volumes <

FOR K in Boot Volumes

> get boot volume backup policy <

oci_json_export.sh

- https://github.com/dbarj/oci-scripts/blob/master/oci_json_export.sh

```
$ oci_json_export.sh
Usage: oci_json_export.sh <option>

<option> - Execution Scope.

Valid <option> values are:
- ALL           - Execute json export for ALL possible options and compress output in a zip file.
- ALL_REGIONS - Same as ALL, but also loop over for all tenancy's subscribed regions.
- BDS-InstDetails
- BDS-Instances
- BV-BVBackups
- BV-BVKey
- Budget-Data
...
```

- 142 options and growing..

```

oci_json_export.sh ALL_REGIONS

- Will loop over all 142 resource types (and growing) on all the regions.
- Create a ZIP file with one JSON file for each resource.
- Extractor is ready. Now I have 142 json files..
- How to LOAD it in a Database ?

SQL> desc OCI360_INSTANCES

Name	Null?	Type
ID		VARCHAR2(128)
SHAPE		VARCHAR2(32)
REGION		VARCHAR2(4)
IMAGE_ID		VARCHAR2(128)
METADATA\$SSH_AUTHORIZED_KEYS		VARCHAR2(512)
IPXE_SCRIPT		VARCHAR2(4)
LAUNCH_MODE		VARCHAR2(16)
SYSTEM_TAGS\$ORCL_CLOUD\$FREE_TIER_RETAINED		VARCHAR2(4)
AGENT_CONFIG\$IS_MANAGEMENT_DISABLED		VARCHAR2(8)
AGENT_CONFIG\$IS_MONITORING_DISABLED		VARCHAR2(8)
DEFINED_TAGS\$ORACLE_TAGS\$CREATEDBY		VARCHAR2(64)
DEFINED_TAGS\$ORACLE_TAGS\$CREATEDON		VARCHAR2(32)
DISPLAY_NAME		VARCHAR2(16)
FAULT_DOMAIN		VARCHAR2(16)

My options:

- I can use a JSON database and write "JSON" like queries..

OR

- I can convert those JSONs entirely into Relational Tables = DBMS_JSON

DBMS_JSON

- Only available from 12.2 onwards.
- **CREATE_VIEW_ON_PATH Procedure.**
 - *"Creates a view with relational columns, using top-level scalar values and the scalar values in the expanded sub-tree under a given path. The JSON column must have a data guide-enabled search index."*
- Getting better on latest 19c/20c release.
- Available in Autonomous Database!

Move JSON file inside the Database

```
-- Create table
CREATE TABLE T_TMP_JSON (
    C_TMP_JSON CLOB,
    CONSTRAINT CK_TMP_JSON CHECK (C_TMP_JSON IS JSON)
)
COMPRESS NOMONITORING
LOB(C_TMP_JSON) STORE AS SECUREFILE (COMPRESS HIGH);

-- Load Table
DECLARE
    l_blob BLOB;
BEGIN
    dbms_lob.createtemporary(l_blob, cache => true, dur => dbms_lob.call);

    l_blob := DBMS_CLOUD.GET_OBJECT(
        credential_name => 'OCI360_CRED',
        object_uri => 'https://objectstorage.us-ashburn-1.oraclecloud.com/n/idgimbpbaoa7/b/oci360_bucket/o/computes.json');

    INSERT INTO T_TMP_JSON (C_TMP_JSON)
    SELECT to_clob(l_blob, 871, 'text/json') FROM dual; -- 871 = UTF8

    COMMIT;

    -- Free temporary LOBs.
    DBMS_LOB.FREETEMPORARY(l_blob);

END;
/
```

Generate a View on JSON Path

```
-- Just to print the code on log file for troubleshooting.
SET PAGES 0 LONG 2000000000 LINES 10000
COL VIEW_CODE FOR A1000
SELECT DBMS_METADATA.GET_DDL('VIEW','V_TMP_JSON') VIEW_CODE
FROM DUAL
WHERE EXISTS (SELECT 1
               FROM USER_VIEWS
              WHERE VIEW_NAME = 'V_TMP_JSON');
SET PAGES 1000 LINES 80

-- Create index
CREATE SEARCH INDEX I_TMP_JSON
ON T_TMP_JSON (C_TMP_JSON) FOR JSON
PARAMETERS ('SEARCH_ON NONE DATAGUIDE ON');

-- Create view.
DECLARE
    empty_data_guide EXCEPTION;
    PRAGMA EXCEPTION_INIT(empty_data_guide , -40591);
BEGIN
    DBMS_JSON.CREATE_VIEW_ON_PATH(
        viewname => 'V_TMP_JSON',
        tablename => 'T_TMP_JSON',
        jcolname => 'C_TMP_JSON',
        path =>      '$.data',
        frequency => 0);
EXCEPTION
    WHEN empty_data_guide THEN
        DBMS_OUTPUT.PUT_LINE('Empty JSON. '); -- handle the error
END;
/
```

Create the Table over the View

```
-- Create table.  
CREATE TABLE OCI360_COMPUTES  
COMPRESS FOR QUERY HIGH NOMONITORING  
AS  
SELECT *  
FROM V_TMP_JSON;  
  
-- Query  
select "C_TMP_JSON$displayname" Name,  
      "C_TMP_JSON$ocpus" OCPUs,  
      "C_TMP_JSON$shape" Shape  
from OCI360_COMPUTES;
```

NAME	OCPUS	SHAPE
oci360comp	1	VM.Standard.E2.1.Micro

So now how do I load'em all?!

- FOR *file* in < oci_json_export.sh output ZIP >
 - Call LOAD SQL:
 - Move Json Inside the Database.
 - Generate View on Json PATH.
 - Create the final Table over the View.

Finally I have the OCI metadata model

```
SQL> desc OCI360_INSTANCES
Name          Null?    Type
-----        -----
ID           VARCHAR2(128)
SHAPE        VARCHAR2(32)
REGION       VARCHAR2(4)
IMAGE_ID     VARCHAR2(128)
METADATA$SSH_AUTHORIZED_KEYS VARCHAR2(512)
IPXE_SCRIPT  VARCHAR2(4)
LAUNCH_MODE  VARCHAR2(16)
SYSTEM_TAGS$ORCL_CLOUD$FREE_TIER_RETAINED VARCHAR2(4)
AGENT_CONFIG$IS_MANAGEMENT_DISABLED VARCHAR2(8)
AGENT_CONFIG$IS_MONITORING_DISABLED VARCHAR2(8)
DEFINED_TAGS$ORACLE_TAGS$CREATEDBY VARCHAR2(64)
DEFINED_TAGS$ORACLE_TAGS$CREATEDON VARCHAR2(32)
DISPLAY_NAME VARCHAR2(16)
FAULT_DOMAIN VARCHAR2(16)
```

```
SQL> desc OCI360_VNICS
Name          Null?    Type
-----        -----
ID           VARCHAR2(128)
NSG_IDS      VARCHAR2(4000)
PUBLIC_IP    VARCHAR2(16)
SUBNET_ID    VARCHAR2(128)
IS_PRIMARY   VARCHAR2(4)
PRIVATE_IP   VARCHAR2(16)
MAC_ADDRESS  VARCHAR2(32)
```

```
SQL> desc OCI360_VNIC_ATTACHS
Name          Null?    Type
-----        -----
ID           VARCHAR2(128)
VNIC_ID      VARCHAR2(128)
VLAN_TAG     NUMBER
NIC_INDEX    NUMBER
SUBNET_ID    VARCHAR2(128)
INSTANCE_ID  VARCHAR2(128)
DISPLAY_NAME VARCHAR2(4)
TIME_CREATED VARCHAR2(32)
COMPARTMENT_ID VARCHAR2(128)
LIFECYCLE_STATE VARCHAR2(8)
AVAILABILITY_DOMAIN VARCHAR2(32)
```

The diagram illustrates the relationships between three Oracle tables: OCI360_INSTANCES, OCI360_VNICS, and OCI360_VNIC_ATTACHS. A black double-headed arrow connects OCI360_INSTANCES and OCI360_VNIC_ATTACHS. A yellow double-headed arrow connects OCI360_VNICS and OCI360_VNIC_ATTACHS.

```
SQL> select table_name
  from user_tables
 where table_name like 'OCI360_%'
 order by 1;
```

All Instances and their primary IPs ?

```
SELECT distinct t1.id,

OCI360

WHAT IS OCI360

- Extractor + Loader + Reporter in one single place.
- Collects OCI Metadata (no computes / volumes data).
- Develops a user friendly and comprehensive view of your tenancy.
- Provides insights about the current configuration and future growth projections.
- Provides a human readable output of your cloud state that allows quicker analysis and faster optimization or resources.

SERVER SPECS TO RUN OCI360

- 2 CPUs
- 8 GiB RAM
- Linux 7
- Oracle XE 18c / Free ADB
- 50 GiB

ONLINE MODE

- EXTRACTOR + CONVERTER + REPORTER are automated in a webserver (at the customer).
- Near REALTIME view of account Tenancy.
- Possibility to check past OCI snapshots for auditing.

FAQ

- How long it takes to run?
- How do I create my own SQLs on it?
- Can I run only a set of the whole output?
